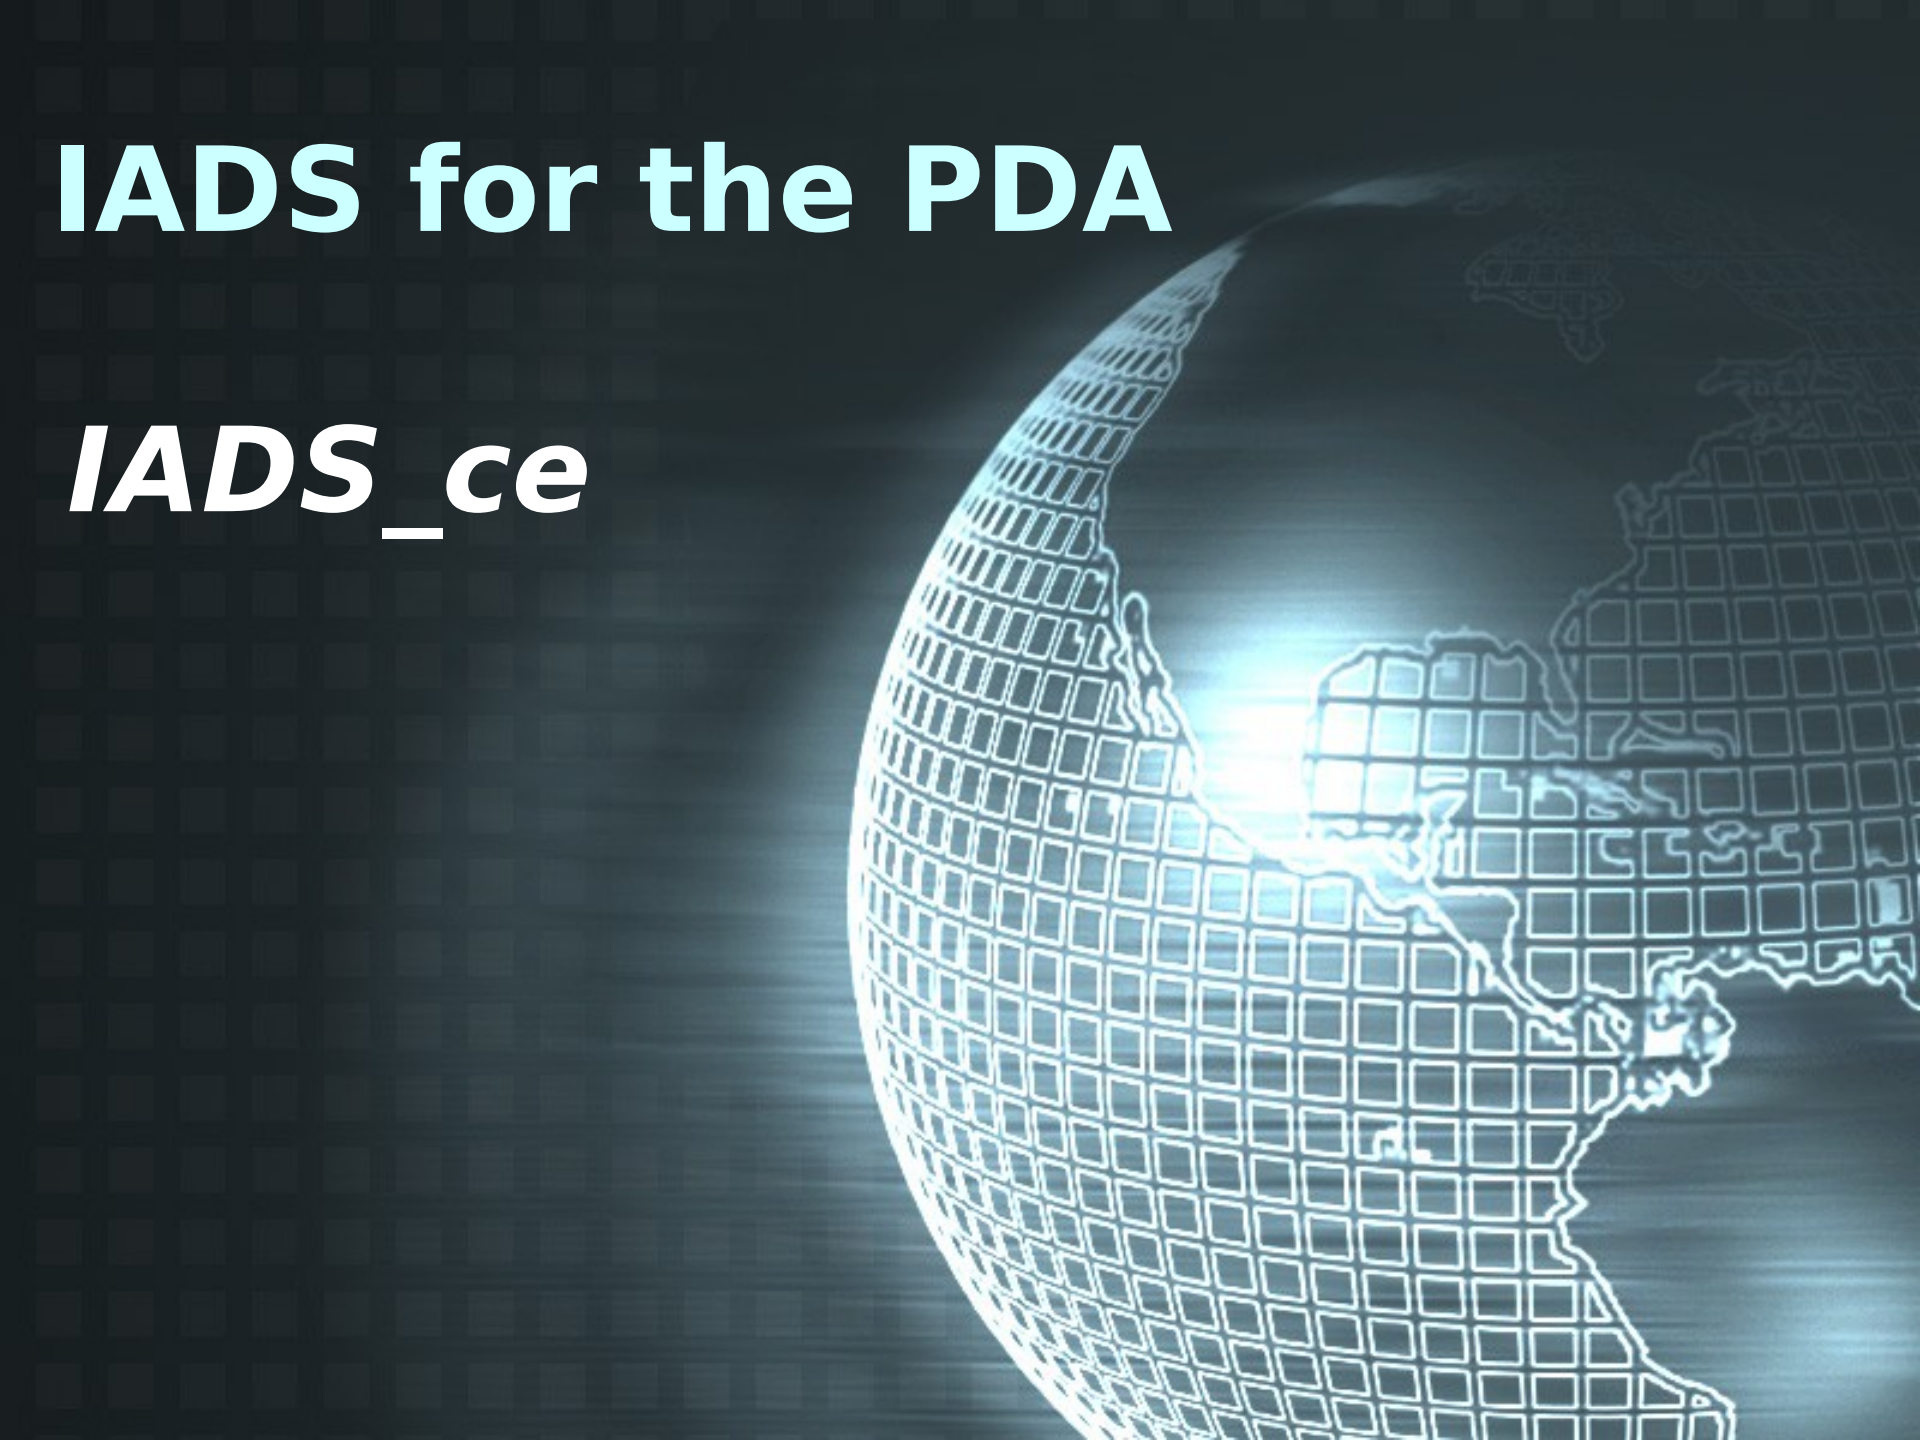
IADS for the PDA

IADS_ce



IADS_ce

- IADS_ce Beta 3 will be available on the IADS website for those wishing to evaluate it and provide feedback to Team IADS.
- Hardware on which the application has been tested have been based on the StrongArm processor (SA-1110) running Windows for Pocket PC 2000 and Windows for Pocket PC 2002.

IADS_ce

Beta-2 release implements:

- Processing of popup alerts and embedded warnings.
- Processing of NEXT and PREVIOUS attributes of frame tags.
- Proper handling of SGML comments.
- The state of input check boxes and radio buttons are now saved when the user navigates the document.
- Table tagging may be placed inside an input FORM section.
- New file open dialog to provide the ability to select files from locations other than just "My Documents".

IADS_ce

Example document created by the Beta testers.

IADS_ce

Example of an embedded warning. The "acknowledge" button must be clicked before the rest of the text on the frame will be displayed.

The ability to recall previously acknowledged warnings, cautions, and notes is under development.

Warning
This caution refers to Step 14
If the EMERGENCY lamp (DS3) is lit, the system was previously placed in emergency shutdown mode. The cause for the emergency shutdown must be determined and corrected before continuing the preparation for use procedure. Failure to determine the need for emergency shutdown may result in a danger to personnel and/or damage to equipment.

IADS_ce

CALS table tagged content within an input form provides the ability to control the layout of check boxes and radio buttons.

IADS_ce

The standard file open dialog box provided with the Pocket PC limits the directory tree that can be used to the “My Documents” branch.

Therefore, a new file open dialog has been incorporated to allow the selection of files from other locations such as the storage card.
